"The complete amino acid sequence of the major component myoglobin of
Amazon river dolphin (Inia geoffrensis).",
Biochemistry 14:5336-5343(1975).
-!- FUNCTION: Serves as a reserve supply of oxygen and facilitates the
movement of oxygen within muscles.
-!- SIMILARITY: Belongs to the globin family.
                                                                                                                                                                                                                                                                                                                                         1 VLSEGEWOLVLHVWAKVEADVAGHGODILIRLFKSHPETLEKFDRFKHLKTEAEMKASED

T "Complete amino acid sequence of the major component myoglobin from recomplete amino acid sequence of the major component myoglobin from this beaked whale, Mesoplodon carlhubbsi.";

Biochim. Biophys. Acta 624:121-129(1980).

I-FUNCTION: Serves as a reserve supply of oxygen and facilitates the movement of oxygen within muscles.

I-SIMILARITY: Belongs to the globin family.

Novel isolated bacterial heme binding protein, HemAT-Hs or HemAT-Bs which reversibly binds oxygen with low affinity, useful for controlled storage of oxygen and for sensing gaseous ligands such as oxygen.

Claim 6; Page 10; 94pp; English.

binding protein, HemAT-Hs or HemAT-Bs which reversibly binds oxygen with low affinity. Haem binding protein is useful for controlled storage of oxygen by allowing haem binding protein to bind and store oxygen, and triggering the release of oxygen from haem binding protein by activating the signalling domain. Haem binding protein is useful for sensing gaseous ligands such as oxygen, NO, CO, or CN. Blood substitute comprising haem binding protein is useful for treating a patient suffering from low blood levels by administering and regulating the oxygen binding of the haembinding protein by modifying the signalling domain. Haem binding protein The present invention relates to isolated archeal and bacterial haem

The present invention relates to isolated archeal and bacterial haem binding protein, HemAT-Hs or HemAT-Bs which reversibly binds oxygen with low affinity. Haem binding protein is useful for controlled storage of oxygen by allowing haem binding protein is useful for sore oxygen, and triggering the release of oxygen from haem binding protein by activating the signalling domain. Haem binding protein is useful for sensing gaseous binding protein is useful for treating a patient suffering from low blood levels by administering and regulating the oxygen binding of the haem-binding protein by modifying the signalling domain. Haem binding protein is useful for tareating signalling domain. Haem binding protein is useful for haem-based catalysis, for artificial photosynthesis and for identifying potential signalling functions of mutated alpha-haemoglobin
                                                                                                                                                                                                                                                                                                                                                           0;
oxygen by allowing haem binding protein to bind and store oxygen, and triggering the release of oxygen from haem binding protein by activating the signalling domain. Heem binding protein is useful for sensing gaseous binding such as oxygen, No. CO, or CN. Blood substitute comprising haem binding protein is useful for treating a patient suffering from low blood levels by administering and regulating the oxygen binding of the haembinding protein by modifying the signalling domain. Heem binding protein is useful for heem-based catalysis, for artificial photosynthesis and for identifying potential signalling functions of mutated alpha-haemoglobin and myoglobin causing several diseases. The present sequence is a haem protein related Halobacterium salinarium protein fragment. (Updated on II-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated bacterial heme binding protein, HemAT-Hs or HemAT-Bs which reversibly binds oxygen with low affinity, useful for controlled storage of oxygen and for sensing gaseous ligands such as oxygen.
                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Haem binding protein; HemAT-Hs; HemAT-Bs; gaseous ligand sensor; oxygen storage; artificial photosynthesis; signalling function; alpha-haemoglobin; myoglobin; therapy.

A second vector may also be used as a cryptic helper plasmid to stably maintain the first plasmid in the host cell. Bacterial Fc receptors such as Frotein G can be used to detect and purify antibodies, and in the treatment of disease. Fc receptors are useful to purify antibodies to be used in the purificn. of protein drugs and as therapeutics. High levels of Protein G can be obtd, in conditions favourable for isolation, using a

E.coli, and expressed at high levels. The variants have a higher binding efficiency and capacity for immunoglobulin, and may be used for purifying, detecting and isolating antibodies.            A 1.9kb HindIII fragment containing the entire coding sequence for Protein G was isolated from Streptococcus GX7809. The Protein G has IgG-binding activity which has been localised to the B repeating structure. Streptococcal Protein G variants comprising the B domains are claimed. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                               Porphorymonas gingivals (PC) polypeptide sequences given in AAY4318 to AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivals. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)

                                                                                PAX91536 to PAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34363. AAX91802 to AAX91898 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                          AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX94318 to AAX943683. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease (Updated on 27-AUG-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Porphorymonas gingivalis; PG; periodontal disease; gingivitis; vaccine;

                                                                                                                                                                                                                                                                                                                                                   AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX94318 to AAX94802 to AAX91809 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        486

imobilised and exhibit different binding profiles. The bound protein is
useful in purification and detection of Igs and fragments. (Updated on 25

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A,Title: Signal transduction in the archaeon Halobacterium salinarium is processed throut A,Reference number: Z22804; MUID:96209786; PMID:8643458
A,Accession: T44978
A,Status: preliminary; translated from GB/EMBL/DDBJ
A,Status: preliminary; translated from GB/EMBL/DDBJ
A,Molecule type: DNA
A,Residues: 1-489 <ZHA>
A,Cross-references: EMBL:U75436; NID:g1654420; PIDN:AAB17881.1; PID:g1654421
A,Reperimental source: strain Flx15
A,Note: the source is designated as Halobacterium salinarium
C,Genetics: And A,Gene: hemAT; htpl5; htb
C;Function:
A,Bescription: involved in aerotactic signal transduction; involved in oxygen sensing; mC;Superfamily: Halobacterium salinarum transducer protein htrl
C;Superfamily: Halobacterium salinarum transducer protein htrl
C;Keywords: heme; methylated amino acid; signal transduction
